This article explains what JPG and JPEG files are and how they're different than other image formats, how to open one, and which programs can convert one to a different image format such as SVG, GIF, or PNG. A JPG or JPEG file (both pronounced "jay-peg") is an image file. While some JPG image files use the .JPG file extension and others use .JPEG, they are both the same type of file. Some JPEG Image files use the .JPE file extension, but that's not very common. JFIF files are JPEG File Interchange Format files that also use JPEG compression, but they aren't as popular as JPG files. JPG files are supported by all image viewers and editors. It's the most widely accepted image format. You can open JPG files with your web browser, like Chrome or Firefox (drag local JPG files onto the browser window), and built-in Microsoft programs like the photo viewer and Paint application. If you're on a Mac, Apple Preview and Apple Photos can open the JPG file. JPG files are widely used because the compression algorithm significantly reduces the size of the file, which makes it ideal for sharing, storing, and displaying on websites. However, this JPG compression also reduces the quality of the image, which might be noticeable if it's highly compressed. IrfanView, Adobe Photoshop, GIMP, and basically any other program that views images, including online services such as Google Drive, support JPG files, too. Mobile devices provide support for opening JPG files as well, which means you can view them in your email and through text messages without needing a specific JPG viewing app. Some websites and programs might not recognize an image as a JPEG Image file unless it has the proper file extension. For example, some basic image editors and viewers will only open JPG files and will not know that the JPEG file you have is the same thing. In those instances, you can just rename the file to have the file extension that the program understands. There are two main ways to convert JPG files. You can either use the image viewer or editor to save it to a new format (assuming that function is supported) or plug the JPG file into an image converter program. For example, FileZigZag is an online JPG converter that can save the file to a number of other formats, including PNG, TIFF/TIFF, GIF, BMP, DPX, TGA, PCX, and YUV. Another really simple option is an application called Resizing.app, and there's a Chrome extension if you plan to perform lots of conversions. Output formats include PNG, TIFF, WEBP, and BMP. You can even convert JPG files to an MS Word format like DOCX or DOC with Zamzar, which is like FileZigZag in that it converts the JPG file online. It also saves JPG to ICO, PS, PDF, and WEBP, among other formats. If you just want to insert a JPG file into a Word document, you don't have to convert the file to an MS Word file format. In fact, a conversion like that doesn't make for a very well-formatted document. Instead, use Word's built-in "insert" option to plug the JPG directly into the document even if you already have text in there. Open the JPG file in Microsoft Paint and use the File > Save as menu to convert it to BMP, DIB, PNG, TIFF, etc. The other JPG viewers and editors mentioned above support similar menu options and output file formats. Using the Convertio website is one way to convert JPG to EPS if you want the image file to be in that format. If that doesn't work, you can try AConvert.com. Some file formats use file extensions that look like JPG files but are in fact unrelated. Examples include JPR (JBuilder Project or Fugawi Projection), JPS (Stereo JPEG Image or Akeeba Backup Archive), and JPGW (JPEG World). So, is there any difference is between JPEG and JPG? The file formats are identical, but one has an extra letter. Really, that's the only difference. Both JPG and JPEG represent an image format supported by the Joint Photographic Experts Group and have the exact same meaning. The reason for the different file extensions has to do with early versions of Windows not accepting the longer extension. Like HTM and HTML files, when the JPEG format was first introduced, the official file extension was JPEG (with four letters). However, Windows had a requirement at that time that all file extensions could not exceed three letters, which is why JPG was used for the exact same format. Mac computers, however, didn't have such a limitation. What happened was that both file extensions were used on both systems, and then Windows changed its requirements to accept longer file extensions, but JPG was still being used. Therefore, both JPG and JPEG files circulated and continue to be created. While both file extensions exist, the formats are the exact same and either can be renamed to the other without a loss in functionality. FAQ How do I open a JPG-Large file? JPG-Large files are image files that Google Chrome creates when a Twitter user saves an image by dragging it onto their desktop; they may also be created when a user right-clicks an image on Twitter and then saves it to their desktop. JPG-Large files are in the same format as JPG or JPEG files. Change their file extension by removing "large," and then open the file as you would any JPG or JPEG image. How do I open a damaged JPG or JPEG file? A JPG or JPEG file can become corrupted when there's a system shutdown during file transfer, if something unexpected happens during the sharing process, when a header file gets corrupted, and various other reasons. To open a damaged or corrupted JPG or JPEG file, try changing the file format, then see if this solves the problem. You can also try opening the damaged JPEG in a program like Paint, then saving the image in another file format. Opening the corrupt file in an image editor, such as Photoshop, may also fix the damaged JPEG. How do I open a JPG or JPEG file in Photoshop? To open a JPG or JPEG in Photoshop, go to File > Open, then navigate to the file and double-click to select and open it. Alternatively, you can drag the file from the folder containing it to the Photoshop icon in your dock (macOS) or right-click the file and chose Photoshop from the Open With menu (macOS or PC). Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! To convert a PDF's pages to JPG on Windows 10, you can either use Adobe's online conversion tool or take a screenshot of each page of your PDF and save that as JPG. We'll show you both these methods. Using Adobe's Online PDF to JPG Conversion Tool Adobe offers an online tool that you can use to convert your PDF files to JPG. Use this method if you want to turn all pages of your PDF into JPG files. To get started, first, open a web browser on your PC. Then, launch Adobe's online PDF to JPG conversion web page. On the web page, in the middle, click the "Select a File" option. A File Explorer window will open. Here, navigate to the folder where your PDF file is located. Double-click the file to upload it to Adobe's tool for the conversion. On the Adobe site, in the "Convert PDF to JPG" section, click the "Convert To" drop-down menu and select "JPG." Then, at the bottom of this section, click "Convert to JPG." Adobe will start converting your file. When your file is converted, on the Adobe site, you'll see a "Your File is Ready" section. In this section, click the "Download" option to download a ZIP archive of the converted files. Save this ZIP file to a folder on your PC. On your PC, open a File Explorer window and access the folder where you saved the ZIP archive. Right-click the ZIP archive and choose Open With > Windows Explorer from the menu. In the folder that opens, you will see a JPG photo for each page of your PDF file. And that's how you automatically turn each page of your PDF into a JPG image! RELATED: How to Quickly Resize Multiple Images on Windows 10 Taking a Screenshot of the PDF File If you don't want to use the online way for PDF to JPG conversion, a local option is to manually capture a screenshot of each of your PDF pages. You can then save these screenshots in JPG format. You should use this method if your PDF has fewer pages. This is because taking a screenshot of each page is tedious work. In cases of large PDFs, the automatic method above is more suitable. To proceed with this manual method, first, open a File Explorer window and find your PDF file. Right-click your PDF file and select Open With > Microsoft Edge. This will open your PDF in the Edge browser, which has a built-in PDF reader. Tip: You can use any PDF reader on your PC. The reason we recommend Edge is that this way you don't have to install a third-party PDF reader on your computer. When your PDF opens in Microsoft Edge, from the toolbar at the top, click the "Fit to Page" option. This option is a square icon with an arrow in each corner. Your Edge window now displays one full page of your PDF file. You'll now use Windows 10's built-in Snip & Sketch tool to take a screenshot of this PDF page. To do this, open the "Start" menu, search for "Snip & Sketch", and click it in the search results. On the Snip & Sketch window that opens, from the top-left corner, select "New." Your computer screen will become shaded, which indicates Snip & Sketch is activated. Now, from the top of your screen, click the "Rectangular Snip" (the first icon) option. Use your mouse or trackpad to select the PDF page area on your screen. This is the area from which Snip & Sketch will capture a screenshot. When the screenshot is captured, you will see it on the Snip & Sketch window. If this screenshot looks good to you, save it by clicking the "Save As" option in the toolbar at the top of the Snip & Sketch window. A "Save As" window will open. Here, you'll save the JPG version of the first page of your PDF file. In this window, select the folder to save your file in. Click the "File Name" field and type a name for your file. Click the "Save as Type" drop-down menu and choose "JPG." Then, at the bottom of this window, click "Save" to save your JPG file. And that's how you manually convert PDF to JPG. Your resulting JPG file is now available in your specified folder. Repeat this process for each page in your PDF file to get a JPG version. Happy JPGing! Are you looking to perform a reverse conversion of this, converting JPG to PDF? Check out our guide on doing just that. RELATED: How to Convert a JPG to PDF on Windows 10
